How to Attempt?

Non-Repeated Digits Count

Write a function to find the count of non-repeated digits in a given number N. The number will be passed to the function as an input parameter of type int.

Assumption: The input number will be a positive integer number ≥ 1 and ≤ 25000 .

Some examples are as below -

If the given number is 292, the function should return 1 because there is only 1 non-repeated digit '9' in this number

If the given number is 1015, the function should return 2 because there are 2 non-repeated digits in this number, '0', and '5'.

If the given number is 108, the function should return 3 because there are 3 non-repeated digits in this number, '1', '0', and '8'.

If the given number is 22, the function should return 0 because there are NO non-repeated digits in this number.

JAVAS

Compiler: Java - 1.8

```
1  import java.io.*;
2  import java.util.*;
3
4  // Read only region start
5  class UserMainCode
6  {
7
8      public int nonRepeatDigitsCount(int input1){
9          // Read only region end
10         // Write code here...
11         String str=Integer.toString(input1);
12         int len=str.length();
13         int count=0,pcount=0;
14         for(int i=0;i<len;i++)
15         {
16             count=0;
17             for(int j=0;j<len;j++)
18             {
19                 if(i!=j)
20                 if(str.charAt(i)==str.charAt(j))
21                 {
22                     count++;
23                     break;
24                 }
25             }
26             if(count==0)
27                 pcount++;
28         }
29         return pcount;
30     }
31 }
